1.   1 / 1 point

The Lunar Lander is a continuous state Markov Decision Process (MDP) because:

○ The state-action value $Q(s, a)$ function outputs continuous valued numbers

○ The reward contains numbers that are continuous valued

⦿ The state contains numbers such as position and velocity that are continuous valued.

○ The state has multiple numbers rather than only a single number (such as position in the x-direction)

✓ **Correct**
   That's right!

---

2.   1 / 1 point

In the learning algorithm described in the videos, we repeatedly create an artificial training set to which we apply supervised learning where the input $x = (s, a)$ and the target, constructed using Bellman's equations, is y = _____?

○ $y = R(s')$ where s' is the state you get to after taking action a in state s

○ $y = \max_{a'} Q(s', a')$ where s' is the state you get to after taking action a in state s

⦿ $y = R(s) + \gamma \max_{a'} Q(s', a')$ where s' is the state you get to after taking action a in state s

○ $y = R(s)$

✓ **Correct**

---

3.   1 / 1 point

You have reached the final practice quiz of this class! What does that mean? (Please check all the answers, because all of them are correct!)

☑ Andrew sends his heartfelt congratulations to you!

✓ **Correct**

☑ What an accomplishment -- you made it!

✓ **Correct**

☑ You deserve to celebrate!

✓ **Correct**

☑ The DeepLearning.AI and Stanford Online teams would like to give you a round of applause!

✓ **Correct**
